is a bonafide record of the work done by the above mentioned candidates in partial fulfilment of the requirements for the award of the degree of "**BACHELOR OF COMPUTER APPLICATIONS** " and has been carried out under my guidance during the Sixth semester of the Academic Year (2025-2026).

Signature of the Guide **Signature of the Academic Director**

ACKNOWLEDGEMENT

ACKNOWLEDGEMENT

First and foremost, we express our praise and thanks to Lord Almighty for his manifold blessing showered on right from admission and till the completion of the project work successfully in the temple of learning.

We endow our grateful thanks and deep sense of gratitude to our respected **PRINCIPAL Dr. P. GAJALAKSHMI, M.Sc., M.Phil. Ph.D.**, Shrimati Indira Gandhi College, Tiruchirappalli and the management for providing us all the Support carry out the project.

We express our thanks and deep sense of gratitude to our **ACADEMIC DIRECTOR Dr. S. RETHINAVALLI, MCA., M.Phil., Ph.D.**, of Computer Applications, Shrimati Indira Gandhi College, Tiruchirappalli for sustained Encouragement shown towards the successful completion of this work.

We express our thanks and deep sense of gratitude to our guide **Ms. T.R.B. VIDHYA M.S.I.T., M.Phil., M.C.A.,** Assistant Professor, Department of Computer Applications, for her guidance and encouragement during the course of our study and in successfully accomplishing this project.

We also submitted our heartfelt thanks to our tutor **MS. J. RATHNA**,**B.E.,M.Tech.,** Assistant Professor, Department of Computer Applications, Shrimati Indira Gandhi College Tiruchirappalli for their motivation and support rendered during the tenure of our course.

ABSTRACT

In present scenario, People are buried up in a heavywork culture, as everyone is engaged with busy schedules. The webApplication portal being designed will help to integrate different functionalities of the organization by coordinating different users of the application through the single portal. A System that provides variety of services like plumbers, movers and packers, repair persons, cleaners, electricians, painters, taxi service, laundry and many more. Although the main objective is to develop a web-based application for home owners with critical home repairs, accessibility modifications, and energy-efficient upgrades. This project helps to bring the communities together in efforts to assist those in need of general home repair and improvements. In this project, the Homeowners must submit a detail with a request. Every person needs helps from the electrician, plumber, mechanic etc. Thus, this web application will enable the user to seek and call them for help. This project will also let the user find them according to their locations, so that help can always come in time when needed.

1. INTRODUCTION

Smart Home Service Hub is a web-based application developed to bridge the gap between service providers and customers through a single digital platform. In today's fast-paced lifestyle, people are deeply engaged in professional responsibilities, academic commitments, and personal activities, leaving them with very little time to search for reliable electricians, plumbers, cleaners, or other home service professionals. Finding trustworthy service providers through traditional methods such as personal references or local advertisements can be time-consuming and uncertain. This system simplifies the entire process by offering an organized, structured, and reliable solution that connects users with verified service providers in just a few clicks.

The application acts as a centralized platform where users can access a wide range of home services anytime and from anywhere using an internet-enabled device. Instead of depending on manual searching or phone-based inquiries, users can browse service categories, compare available providers, and book professionals instantly through the online portal. This digital approach not only saves time but also ensures convenience and accessibility, especially during emergencies where immediate service is required.

The primary objective of the Smart Home Service Hub is to provide a unified platform that integrates multiple home services under one system. It aims to significantly reduce the time and effort required to locate skilled service providers by offering categorized and location-based search options. Another major objective of the system is to ensure secure communication and safe financial transactions between users and service providers through proper authentication and online payment integration. Furthermore, the system enhances service transparency and accountability by maintaining digital records of bookings, payments, complaints, and feedback. This structured management approach improves trust, reliability, and overall customer satisfaction.

Overall, the Smart Home Service Hub transforms the traditional method of home service booking into a modern, efficient, and user-friendly digital solution that benefits both customers and service providers.

2. SYSTEM ANALYSIS

System analysis is the process of studying the current system, identifying its problems, and proposing an improved solution. It helps in understanding the limitations of the existing manual approach and designing a better, more efficient digital system.

2.1 EXISTING SYSTEM

In the existing system, home service management is mostly handled manually or through informal contacts. Users depend on neighbors, friends, or local advertisements to find service providers like electricians, plumbers, or cleaners.

Working of Existing System

- Users search manually for service providers.
- Services are booked through phone calls or direct visits.
- No structured record of bookings.
- Payments are usually made in cash.
- Complaints are handled informally without proper tracking.

Detailed Problems in Existing System

1. Manual Searching Process

Users must spend time calling different service providers or asking for recommendations. This leads to:

- Wastage of time
- Uncertainty in availability
- Difficulty in comparing service quality

2. No Centralized Platform

There is no single platform where all services are available. Each service provider operates independently, making it difficult to manage or verify them.

3. No Proper Booking Management

Bookings are not recorded digitally. There is:

- No confirmation message
- No booking ID
- No service history record

4. No Secure Payment Integration

Payments are usually done in cash. This leads to:

- No payment proof
- Risk of overcharging
- Lack of transparency

5. Difficult to Track Complaints and Feedback

If a user faces issues:

- There is no formal complaint system
- No proper follow-up mechanism
- No rating system

6. High Chances of Fraud or Delay

Since there is no verification system:

- Fake service providers may operate
- Delays in service delivery
- Unreliable professionals

Disadvantages of Existing System

- Time-consuming process

- Lack of reliability and trust
- No real-time tracking of service
- Poor communication between users and providers
- No transparency in pricing
- No accountability

The existing system lacks automation, organization, and security.

2.2 PROPOSED SYSTEM

The proposed **Smart Home Service Hub** is a web-based centralized platform that digitizes the entire service booking process. It integrates users, service providers, and administrators into a single system.

Working of Proposed System

- Users register and log in.
- Search services based on location and category.
- Book services online.
- Make secure online payments.
- Track booking status.
- Post complaints and feedback.
- Admin monitors and manages all activities.

Detailed Features of Proposed System

1. Centralized Web Portal

All services are available on one platform. This ensures:

- Easy navigation
- Organized management
- Better control

2. Online Service Booking

Users can:

- Select service type
- Choose date and time
- Confirm booking instantly

This reduces manual effort and ensures proper documentation.

3. Location-Based Service Search

The system filters service providers based on user location. Benefits include:

- Faster response time
- Reduced travel cost
- Quick emergency services

4. Online Payment Integration

Users can make secure payments through:

- Debit/Credit cards
- UPI
- Net banking

This ensures:

- Payment proof
- Transparency
- Reduced fraud

5. Complaint and Feedback System

Users can:

- Post complaints
- Track complaint resolution
- Provide ratings and feedback

This improves service quality and accountability.

6. Admin Monitoring and Management

The admin:

- Approves service providers
- Monitors bookings
- Manages complaints
- Tracks payments
- Maintains database security

Advantages of Proposed System

- Saves time and effort
- Easy and quick booking process
- Secure and transparent transactions
- Real-time service tracking
- Better communication system
- Verified service providers
- Organized database management
- Improved customer satisfaction

COMPARISON SUMMARY

Feature	Existing System	Proposed System
Booking	Manual	Online
Payment	Cash	Secure Online
Record Keeping	No	Yes
Complaint Tracking	Informal	Digital System
Transparency	Low	High
Reliability	Uncertain	Verified Providers

3. SYSTEM CONFIGURATION

3.1 Hardware Specification

- Processor : Intel Core i3 or above
- RAM : 4GB minimum
- Hard Disk : 500GB
- Monitor : 15” LED
- Internet Connection

3.2 Software Specification

- Front End : HTML, CSS, JavaScript
- Back End : Node Js
- Database : MySQL
- Operating System : Windows 11

4. PROJECT DESCRIPTION

The Smart Home Service Hub is a web-based application developed to provide an organized and efficient solution for managing home services. The project integrates frontend technologies for user interaction and backend technologies for server-side processing and database management.

The system follows a **client-server architecture**, where users interact with the application through a web browser. All user requests are sent to the server, processed using backend logic, and stored or retrieved from the database. The response is then displayed back to the user through the interface.

This architecture ensures better performance, scalability, and secure data handling.

4.1 Software Description

The Smart Home Service Hub is developed using the following technologies:

1. HTML (HyperText Markup Language)

HTML is used to design and structure the web pages of the application. It defines the layout and arrangement of elements such as:

- Registration forms
- Login pages
- Service listing pages
- Booking forms
- Admin dashboard
- Feedback and complaint forms

HTML ensures proper organization of content including text, images, input fields, buttons, and navigation menus. It forms the foundation of the user interface.

2. CSS (Cascading Style Sheets)

CSS is used to enhance the visual presentation of the application. It controls:

- Page layout design
- Color schemes and themes
- Fonts and typography
- Spacing and alignment
- Button and form styling
- Responsive design for different screen sizes

CSS improves the overall user experience by making the website visually appealing, professional, and easy to navigate.

3. JavaScript

JavaScript is used to implement interactive features and client-side validation. It helps in:

- Validating login and registration forms
- Checking empty or incorrect fields
- Displaying real-time error messages
- Enhancing user interaction
- Handling dynamic content updates

By performing validation on the client side, JavaScript reduces unnecessary server requests and improves application performance.

4. Node.js

Node.js is used as the backend runtime environment. It handles server-side operations and manages communication between the frontend and the database.

Node.js is responsible for:

- User authentication and authorization
- Processing booking requests
- Handling online payments

- Managing complaints and feedback
- Creating API routes
- Connecting to the MySQL database
- Sending responses to the client

Node.js provides high performance, scalability, and non-blocking architecture, making the application efficient and responsive.

5. MySQL

MySQL is used as the relational database management system (RDBMS). It stores all structured data required for the system, including:

- User details
- Service provider details
- Service categories
- Booking records
- Payment information
- Complaints and feedback

The database ensures:

- Secure data storage
- Data consistency and integrity
- Fast data retrieval
- Structured record management

All sensitive information is stored securely with proper database constraints and validations.

System Architecture Overview

The Smart Home Service Hub follows this workflow:

1. The user interacts with the web interface built using HTML, CSS, and JavaScript.
2. The request is sent to the server.
3. Node.js processes the request.
4. Data is stored or retrieved from the MySQL database.
5. The server sends the response back to the client.
6. The result is displayed to the user.

This structured workflow ensures smooth communication between frontend and backend components.

4.2 Modules Description

The system is divided into three main modules:

- Admin Module
- Servicer Module
- User Module

Each module has specific responsibilities and access control.

1. Admin Module

The Admin is the central authority of the system. This module ensures proper monitoring, management, and control of all system activities.

Functions of Admin Module

1. Login

The Admin logs into the system using secure credentials for authorized access.

2. View Staff Details

The Admin can:

- View registered service providers
- Verify their submitted details
- Approve, reject, or manage service provider accounts

3. View User Details

The Admin monitors:

- Registered users
- Account status
- User activity

4. Add Service

The Admin can:

- Add new service categories
- Update existing services
- Remove outdated or inactive services

5. View Complaints

The Admin can:

- Monitor complaints submitted by users
- Assign issues to service providers
- Track complaint resolution status

6. View Booking Information

The Admin can access:

- All booking records

- Booking dates and times
- Service types
- User and servicer details

7. View Payment Information

The Admin tracks:

- Payment transactions
- Payment status
- Revenue reports

8. View Feedback Information

The Admin can:

- Monitor ratings and feedback
- Evaluate service quality
- Take corrective actions if necessary

The Admin module ensures proper system supervision and data control.

2. Servicer Module

The Servicer module is designed for professionals such as electricians, plumbers, cleaners, mechanics, etc.

Functions of Servicer Module

1. Register

Service providers register by submitting:

- Name
- Contact details
- Service category
- Location

- Experience details

Registration may require Admin approval.

2. Login

After successful registration, servicers log in securely to access their dashboard.

3. Update Service Details

Servicers can:

- Update availability status
- Modify service descriptions
- Change pricing details
- Update contact information

4. View User Booking Information

Servicers can:

- View booking requests
- Check service date and time
- Accept or manage service requests

This allows service providers to organize their work schedules effectively.

3. User Module

The User module is designed for customers who require home services.

Functions of User Module

1. Register

Users create an account by providing:

- Name

- Email
- Contact number
- Address
- Password

2. Login

Users log in securely using registered credentials.

3. View Service Details

Users can:

- Browse available services
- View service descriptions
- Compare pricing
- Check ratings and feedback

4. Book Service

Users can:

- Select service category
- Choose preferred date and time
- Confirm booking

A booking record is automatically stored in the database.

5. Online Payment

Users make secure online payments. Payment details are stored for transaction reference.

6. Post Complaint

If any issue arises, users can:

- Submit complaints

- Describe the problem
- Track complaint resolution status

7. View Solution

Users can view responses or solutions provided by the Admin or Servicer.

8. Logout

Users can securely log out of the system to protect their account.

5. SYSTEM DESIGN

System Design describes how the Smart Home Service Hub system is structured and how different components interact with each other. It provides a clear understanding of system functionality, data flow, and interaction between users and the application.

The system design is represented using:

- Use Case Diagram
- Data Flow Diagram
- Sequence Diagram

5.1 Use Case Diagram

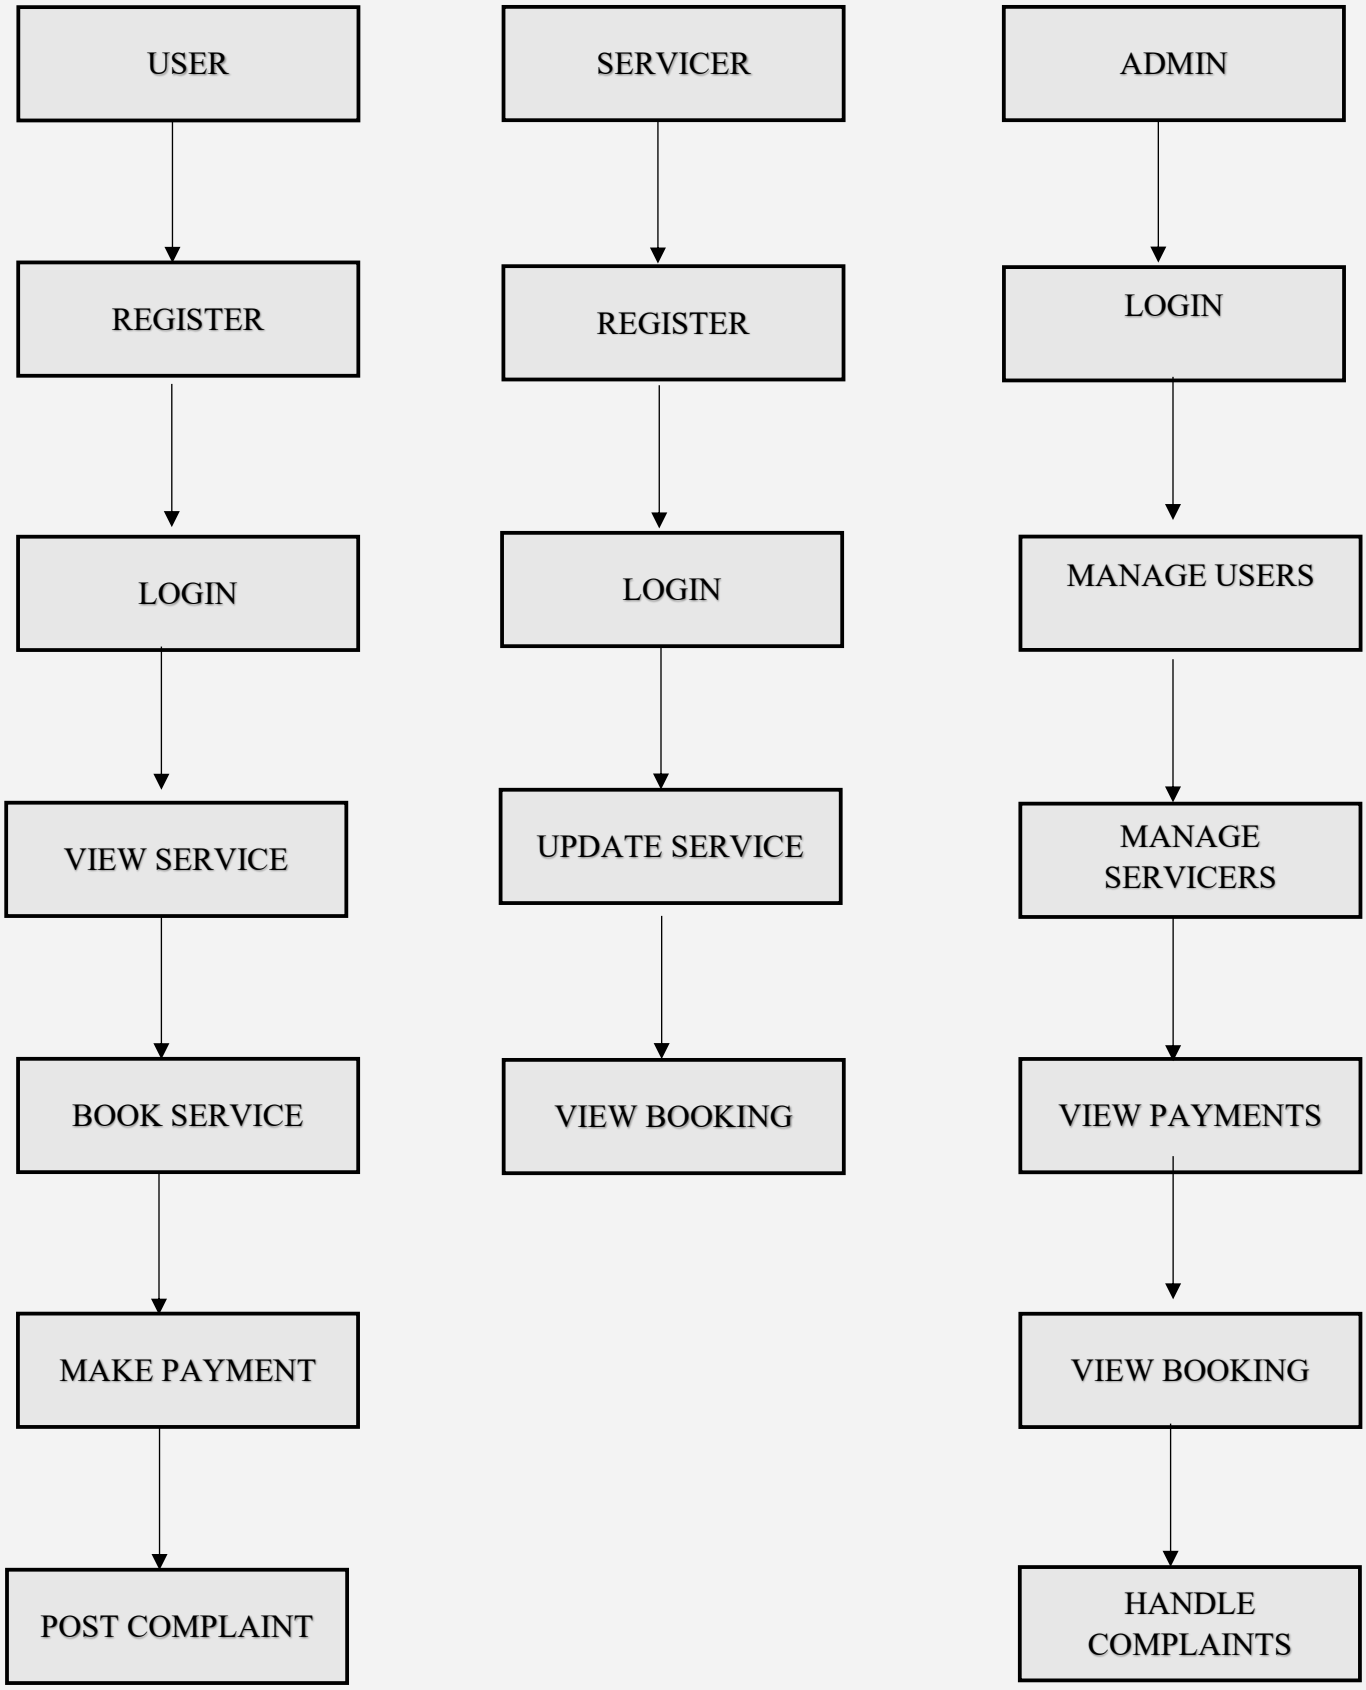
The Use Case Diagram represents the functional requirements of the Smart Home Service Hub. It shows the interaction between different actors and the system. The main actors in this system are **Admin, User, and Servicer**.

The **User** can register, log in, view available services, book services, make online payments, post complaints, view solutions, and log out. These actions represent the services that the system provides to customers.

The **Servicer** can register, log in, update service details, and view booking requests made by users. This helps service providers manage their availability and respond to customer requests efficiently.

The **Admin** has full control over the system. The Admin can log in, manage users, manage service providers, add or update service categories, view booking details, monitor payments, handle complaints, and review feedback.

The Use Case Diagram clearly illustrates how each actor interacts with the system and helps in understanding the overall functionality of the application.



USER

BOOK SERVICE
MAKE PAYMENT
POST COMPLAINT
SERVICER
REGISTER
LOGIN
UPDATE SERVICE
VIEW BOOKING
ADMIN
LOGIN
MANAGE USERS
MANAGE SERVICERS
VIEW PAYMENTS
VIEW BOOKING
HANDLE COMPLAINTS

5.2 Data Flow Diagram (DFD)

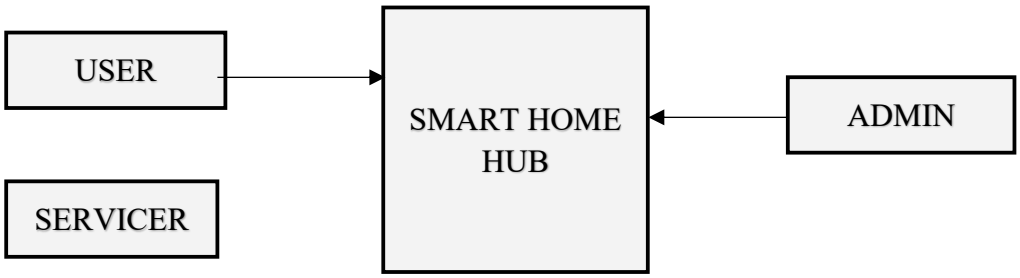
The Data Flow Diagram (DFD) represents how data moves within the Smart Home Service Hub system. It shows the flow of information between users, processes, and the database.

DFD Level 0

The Level 0 DFD provides a high-level view of the system. It shows the Smart Home Service Hub as a single process interacting with external entities such as User, Servicer, and Admin.

- The User sends registration details, booking requests, payments, and complaints to the system.
- The system sends booking confirmations and responses back to the user.
- The Servicer receives booking information from the system.
- The Admin receives reports and monitors system activities.

This level shows the overall interaction without detailed internal processes.



DFD Level 1

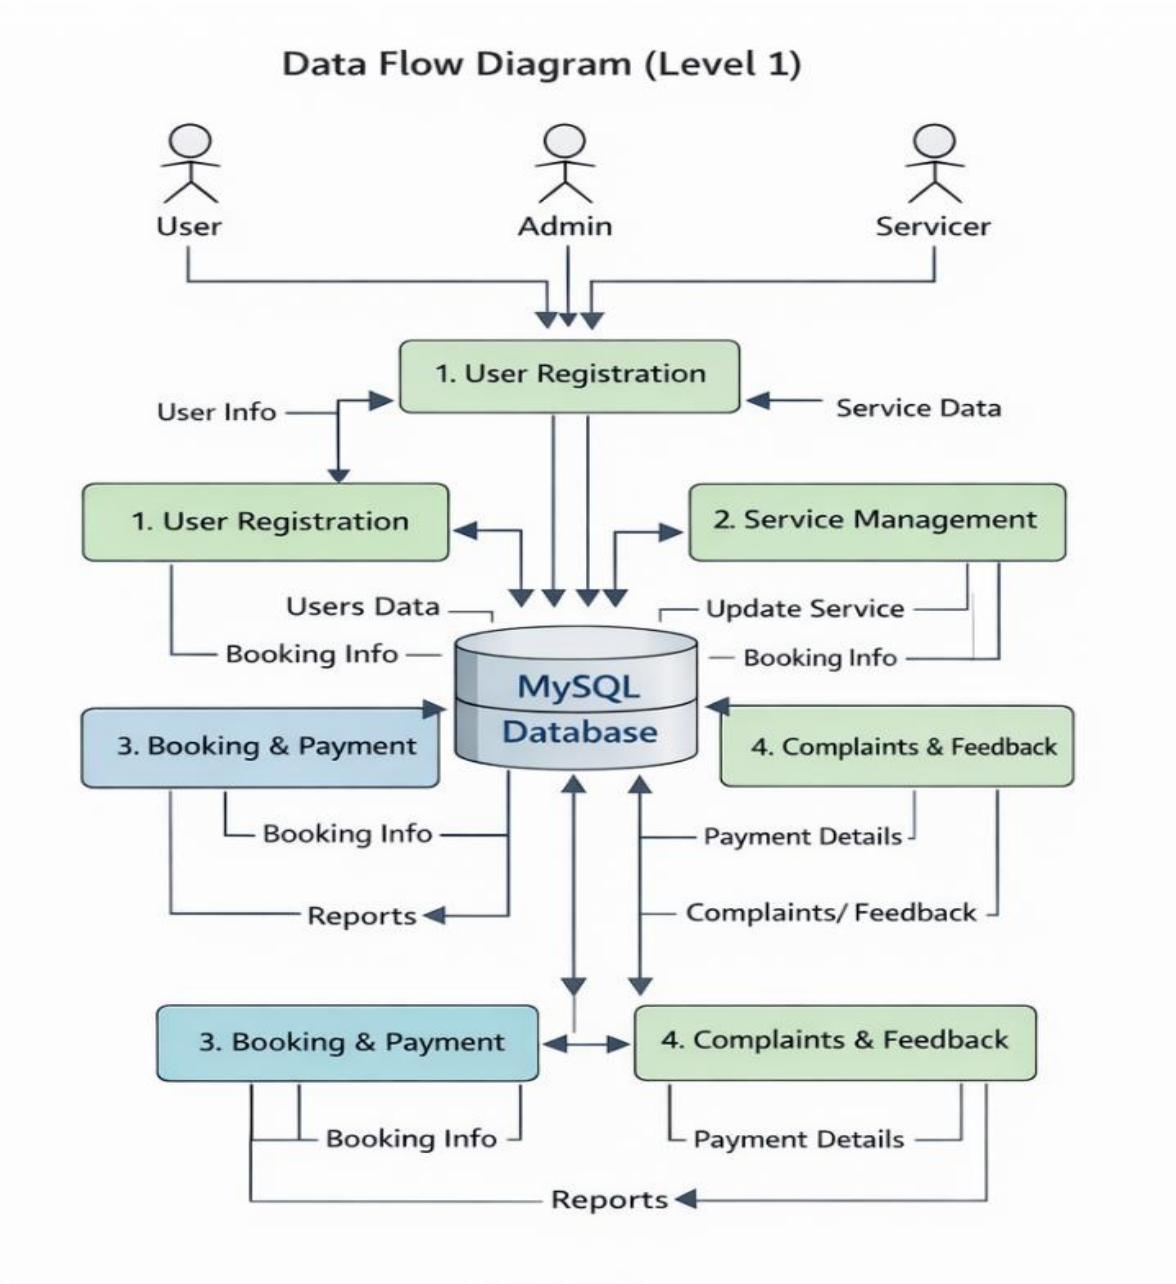
The Level 1 DFD provides a more detailed explanation of the internal processes of the system. It breaks the main system into multiple sub-processes such as:

1. Registration and Login Process
2. Service Management Process
3. Booking Process
4. Payment Processing
5. Complaint and Feedback Management

Each process interacts with the MySQL database to store and retrieve information. For example:

- During registration, user data is stored in the database.
- During booking, service details and booking records are saved.
- During payment, transaction information is recorded.
- Complaints and feedback are stored for monitoring and improvement.

Level 1 DFD



Data Flow:

- User → Booking details
- System → Booking confirmation
- Servicer ← Booking request
- Admin ← Reports & Monitoring

5.3 Sequence Diagram

The Sequence Diagram shows the order of interactions between different components of the system over time. It represents how a particular process, such as booking a service, is executed step-by-step.In the Smart Home Service Hub, the sequence for booking a service works as follows:

1. The User logs into the system.
2. The request is sent from the browser to the Node.js server.
3. The server verifies login details using the MySQL database.
4. After successful login, the user selects a service and confirms booking.
5. The booking request is sent to the server.
6. The server stores booking details in the database.
7. A confirmation message is sent back to the user.
8. The Servicer receives the booking notification.

The Sequence Diagram helps in understanding the time-based flow of events and communication between:

- User
- Web Interface
- Node.js Server
- MySQL Database
- Servicer

It ensures that the system processes requests in a proper and logical order.

6. TESTING

System testing is an important phase in the development of the Smart Home Service Hub. It ensures that the application works correctly, efficiently, and securely before deployment. Testing helps identify errors, improve performance, and ensure that all modules function according to the system requirements.

6.1 Unit Testing

Unit Testing is the process of testing individual modules or components of the system separately to ensure that each part works correctly. In the Smart Home Service Hub system, every module was tested independently before integration.

Modules Tested:

1. Login Module

- Verified valid and invalid login credentials.
- Checked error messages for incorrect username/password.
- Tested empty field validation.
- Verified password encryption and secure authentication.
- Confirmed proper session creation and logout functionality.

2. User Registration Module

- Tested mandatory field validation.
- Checked duplicate email/username prevention.
- Verified successful data storage in the database.
- Confirmed success and error message display.

3. Booking Module

- Verified service selection functionality.
- Tested date and time validation.
- Checked database storage of booking information.
- Confirmed booking confirmation message generation.

4. Payment Module

- Tested successful and failed transactions.
- Verified payment status updates.
- Checked secure handling of payment details.
- Confirmed prevention of duplicate payments.

5. Complaint Module

- Verified complaint submission.
- Tested database storage of complaints.
- Checked admin response functionality.
- Verified status updates (Pending/Resolved).

Unit testing ensured that each module performs its intended function accurately without errors.

6.2 System Testing

System Testing is conducted after integrating all modules to verify that the complete system works as expected. It evaluates the system's compliance with functional and non-functional requirements.

1. Functional Testing

- Verified complete user workflow (Register → Login → Book Service → Payment → Complaint).
- Ensured correct interaction between frontend and backend.
- Checked report generation and admin controls.

2. Performance Testing

- Tested system response time during multiple user access.
- Verified database performance under load.
- Checked server stability during peak usage.

3. Security Testing

- Tested protection against SQL injection.
- Verified password encryption.
- Checked secure session handling.
- Ensured proper role-based access (User/Admin/Servicer).

4. Usability Testing

- Evaluated user interface simplicity.
- Checked navigation flow.
- Verified clarity of messages and notifications.

System testing confirmed that the entire application works efficiently and reliably.

6.3 Integration Testing

Integration Testing ensures that different modules of the system interact correctly with each other.

Areas Tested:

1. **User & Database Integration**
    - Verified that user registration data is correctly stored and retrieved.
2. **Booking & Payment Integration**
    - Ensured payment is linked to the correct booking.
    - Verified booking confirmation after successful payment.
3. **Admin & Service Management Integration**
    - Checked that admin can view and manage user bookings.
    - Verified service updates reflect immediately in the system.
4. **Complaint & Dashboard Integration**
    - Confirmed complaints appear in admin panel.
    - Verified status updates are visible to users.

Integration testing ensured smooth data flow between modules and confirmed that the system works as a unified application.

7. SOFTWARE IMPLEMENTATION

CONCLUSION

The Smart Home Service Hub system was successfully designed and developed to simplify the process of booking home services online. The system integrates user registration, service management, booking, payment processing, and complaint handling into a single platform.

Through proper system design techniques such as Use Case Diagram, Data Flow Diagram, and Sequence Diagram, the overall structure and workflow of the system were clearly defined. Implementation of modules like login validation, booking management, and payment processing ensures smooth and secure operations.

Testing was conducted at both unit and system levels to verify functionality, performance, and security. The results show that the system is reliable, efficient, and user-friendly. It reduces manual effort, saves time, and improves service management for users, administrators, and service providers.

Overall, the project achieves its objective of providing a centralized and automated home service booking platform.

FUTURE ENHANCEMENTS

Although the current system meets the basic requirements, several enhancements can be implemented in the future to improve functionality and scalability:

1. **Mobile Application Development**
   Develop Android and iOS mobile applications for easier access.
2. **Real-Time Service Tracking**
   Add GPS tracking to monitor service provider location in real time.
3. **Online Chat Support**
   Integrate live chat between users and service providers.
4. **Advanced Payment Gateway Integration**
   Support multiple payment options like UPI, wallets, and international cards.
5. **Rating and Review System**
   Allow users to rate services and provide detailed feedback.
6. **AI-Based Service Recommendations**
   Suggest services based on user history and preferences.
